Experience

Embedded Software Engineer, SpaceX / Starlink — Jul 2026 – Present
C, C++, Python, Git — Bastrop, TX

- Cut the run time of a per-antenna math calculation by 11%, speeding up Starlink phased array software
- Wrote embedded drivers in C and C++ for Starlink phased array hardware

Software Engineering Intern, Kratos Defense — Jun – Aug 2025
C++ — Colorado Springs, CO

- Sped up legacy real-time DSP code in C++ by 1.6x through refactoring and AVX-512 vectorization
- Demonstrated a faster way to code a FIR filter and presented the gains to the team for future projects
- Built a logging framework with configurable severity levels and error tracking

Projects

Non-Linear State Estimation for the EMBR Damper, MATLAB, Simulink — Spring 2026

- Designed a non-linear state estimation strategy for the semi-active EMBR suspension, modeling the interactions of a custom magnetorheological (MR) fluid damper, MOSFET power regulation, and a multi-sensor array
- Derived continuous and discrete-time non-linear state-space models in MATLAB and Simulink, simulating system kinematics to validate damping performance against harmonic, stochastic, and discrete terrain disturbances
- Implemented and compared Extended (EKF) and Unscented (UKF) Kalman Filters to estimate unmeasured states

Pitch-Tracking Systems in Auto-Tune, MATLAB — Spring 2026

- Measured latency and residual error to verify the performance of real-time Fast Fourier Transform (FFT) and Autocorrelation (ACF) pitch-tracking algorithms in MATLAB
- Designed automated data visualization scripts to quantify computational processing time, demonstrating a 2.68x execution speedup for FFT over ACF
- Validated overall pitch-tracking system effectiveness across an 8000 Hz decimated signal chain with cascaded Butterworth band-pass filters

Autonomous Maze-Navigating Robot, Python — Fall 2025

- Achieved the second-fastest course completion time in the cohort with an autonomous maze-navigating robot built by a 4-person team, integrating computer vision, embedded control, and I2C communication
- Built the computer vision subsystem with one teammate, using Python and OpenCV with ArUco marker detection to extract real-time distance and angle metrics for navigation
- Designed a multithreaded vision pipeline processing 640x480 video feeds with HSV color masking to identify directional markers for pathfinding logic
- Interfaced the vision subsystem with motor control via I2C bus, transmitting telemetry data to an Arduino while updating a real-time RGB LCD display

Skills

Skills: C++, Python, C, SIMD, MATLAB, Simulink, Git, Arduino

Education

Colorado School of Mines — May 2026
BS Electrical Engineering, Minor in Computer Science
Relevant Coursework: Signals and Systems I/II, Algorithms, Digital Signal Processing, Estimation Theory & Kalman Filtering, Modern Control Design, Embedded Systems, Computer Architecture, Software Engineering
